

Why to use Firefox or Brave

96% of people browsing the internet use Google Chrome or other google products, but this is helping google to collect more and more data about you and profiles you. Over the years, there have been many alternatives to Google Chrome, but all of them were based on

Chromium which is the open source version of google chrome, but there was only one actual alternative to Google Chrome, Mozilla Firefox.

Hence I recommend Firefox for anyone with a little computer knowledge.

Firefox is fast, has great dev tools websites load faster and it has tons of great extensions (addons) available at

<https://addons.mozilla.org>, and most importantly, Mozilla has a good track record about privacy. Although there was a little controversy that google was slowly down its products on a Mozilla Gecko (Firefox) browser but it was solved. Moreover Firefox also has many other cool features. I have listed them in one of the guides I made. Firefox

also blocks super cookies now. It is the best Browser for geeks. One con of Firefox browser is that you have to manually configure it to be private and secure. It doesn't have privacy out of the box.

Next browser that I recommend for normal user is Brave Browser.

The Brave Browser is based on Chromium browser and is a great

alternative to Google Chrome. It is actually faster than chrome. It automatically blocks ads and trackers. No need to install any addons or extensions and configurations. Brave is also great and easy to use. You can easily use it like a google chrome and sign in to your google account. It has everything built

right-in. Hence I recommend this to all new user and experienced users.

Hence I want all of you to please uninstall Google Chrome and use either Firefox or Brave. Be sure to use securafire and brav2fast to use Firefox and Brave. Thanks for Reading. -NOOB SCIENCE-
